this book was developed to address a need quantitative literacy courses have been established in the mathematics curriculum for decades now the students in these courses typically dislike and fear mathematics and the result is often a class populated by many students who are unmotivated and uninterested in the material this book is a text for such a course however it is focused on a single idea that most students seem to already have some intrinsic interest in and is written at an accessible level it covers the basic ideas of discrete probability and shows how these ideas can be applied to familiar games roulette poker blackjack etc the gambling material is interweaved through the book and introduced as soon as the necessary mathematics has been developed throughout mathematical formalism and symbolism have been avoided and numerous examples are provided the book starts with a simple definition of probability goes through some basic concepts like combining events and expected value and then discusses some elementary mathematical aspects of various games roulette is introduced very early on as is the game of craps which requires some knowledge of conditional probability other games like poker blackjack and lotteries whose study requires some rudimentary combinatorics come shortly thereafter the book ends with a brief introduction to zero sum games with some attention paid to the use of these ideas in studying bluffing in addition to discussion of these traditional games the author motivates probability by talking about a few applications in legal proceedings that illustrate how mathematics has been misused in the courtroom there is also a discussion of the monty hall problem a nonintuitive result in probability that has an interesting and colorful history hopefully students studying from this text will find that mathematics is not as horrible as they have always thought and offers some interesting applications in the real world this should perhaps be the goal of any quantitative literacy course

described in the text each chapter contains illustrative examples and exercises

this textbook is aimed at computer science undergraduates late in sophomore or early in junior year supplying a comprehensive background in qualitative and quantitative data analysis probability random variables and statistical methods including machine learning with careful treatment of topics that fill the curricular needs for the course probability and statistics for computer science features a treatment of random variables and expectations dealing primarily with the discrete case a practical treatment of simulation showing how many interesting probabilities and expectations can be extracted with particular emphasis on markov chains a clear but crisp account of simple point inference strategies maximum likelihood bayesian inference in simple contexts this is extended to cover some confidence intervals samples and populations for random sampling with replacement and the simplest hypothesis testing a chapter dealing with classification explaining why it s useful how to train svm classifiers with stochastic gradient descent and how to use implementations of more advanced methods such as random forests and nearest neighbors a chapter dealing with regression explaining how to set up use and understand linear regression and nearest neighbors regression in practical problems a chapter dealing with principal components analysis developing intuition carefully and including numerous practical examples there is a brief description of multivariate scaling via principal coordinate analysis a chapter dealing with clustering via agglomerative methods and k means showing how to build vector quantized features for complex signals illustrated throughout each main chapter includes many worked examples and other pedagogical elements such as boxed procedures definitions useful facts and remember this short tips problems and programming exercises are at the end of each chapter with a summary of what the reader should know instructor resources include a full set of model solutions for all problems and an instructor s manual with accompanying presentation slides

first a method of representing heuristics as production rules is developed which facilitates dynamic manipulation of the heuristics by the program embodying them this representation technique permits separation of the heuristics from the program proper provides clear identification of individual heuristics is compatible with generalization schemes and expedites the process of obtaining decisions from the system second procedures are developed which permit a problem solving program employing heuristics in production rule form to learn to improve its performance by evaluating and modifying existing heuristics and hypothesizing new ones either during a special training process or during normal program operation third the abovementioned representation and learning techniques are reformulated in the light of existing stimulus response theories of learning and five different s r models of human heuristic learning in problem solving environments are constructed and examined in detail experimental designs for testing these information processing models are also proposed and discussed finally the feasibility of using the aforementioned representation and learning techniques in a complex problem solving situation is demonstrated by applying these techniques to the problem of making the bet decision in draw poker this application involving the construction of a computer program demonstrates that few production rules or training trials are needed to produce a thorough and effective set of heuristics for draw poker author
