this study presents new microeconomic analyses of congestion prone services that comprise most private and public services at the final consumption stage it accounts for two distinctive features of congestion prone services the discrepancy between capacity and throughput and service quality competition to accommodate these features a series of new decision making theorems for consumers and suppliers is developed the resulting demand and cost functions incorporate service time as the variable that reflects congestion and service quality in market equilibrium interactions between consumers and firms endogenously determine the industrial organization type of each firm and thus allow the coexistence of multiple industrial organization types in the same market efficiency of resource allocation is assessed by applying two different criteria service quality diversity throughout the market and pareto optimality in each submarket

this monograph contains a collection of integrals some more challenging than others with their worked out solutions as indefinite integrals the integrals were randomly selected modified or designed with the condition of having closed forms solutions with common functions this list is meant for helping readers in practicing and getting hints for working out solutions to similar integrals that they might encounter readers might want to add their own favorite integrals to this list we also present the application of some integrals in engineering related topics for example nonuniform loading hydrostatic force moment of inertia polar moment of inertia etc we introduce an up to date online software tool wolframalpha that can be used for comparing our answers for the integrals listed however readers may want to update to wolframalpha pro for recovering some of the integrals step by step solutions in addition similar cas computer algebra system tools like maple mathematica or mathcad may also be employed

choquet capacities which provide the weighting mechanism for the choquet and other fuzzy integrals model synergistic and antagonistic interactions between variables by assigning value to all subsets rather than individual inputs while the flexibility of capacities also referred to as fuzzy measures and cooperative games comes at the expense of an exponentially increasing number of parameters the ability to explain their behavior using various value and interaction indices makes them appealing for applications requiring transparency and interpretability as well as a number of useful indices that in some way capture the extent to which positive and negative interactions occur significant progress has been made in addressing the scalability issues that arise in applications this book provides a detailed overview of the background concepts relating to capacities and their role in fuzzy integration and aggregation then presents specialised chapters on most recent results in learning random sampling and optimization that involve choquet capacities topics and features if supportlists endif fundamentals of choquet capacities fuzzy measures and their use in modeling importance and interaction between variables if supportlists endif definitions properties and mappings between alternative representations that allow capacities and fuzzy integrals to be interpreted and applied in different settings if supportlists endif various simplification assumptions from k additive p symmetric and l measures to more recent concepts such as k interactive and hierarchical frameworks if supportlists endif capacity learning formulations that allow the diverse types to be elicited from datasets or according to user specified requirements if supportlists endif recent findings related to random sampling and optimisation with choquet integral
