adhesives were utilized in a sophisticated manner even in ancient times recent years have seen the rapid development of adhesive bonding as an economic and effective method for the fabrication of components and assemblies the great many types of adhesives are currently in use and there is no adequate single system of classification for all products the adhesives industry has generally employed classifications based on end use such as metal to metal adhesives wood adhesives general purpose adhesives paper and packaging adhesives etc an adhesive or formulation is generally a mixture of several materials the extent of mixture and the ratio usually depend upon the properties desired in the final bonded joint the basic materials may be defined as those substances which provide the necessary adhesive and binding properties the type of adhesive material is easier to define and usually falls into three categories thermosetting resins thermoplastic resins and elastomeric resins a thermosetting system 100 percent reactive when in a pure state the epoxies are very desirable and more widely used than any other chemical type epoxy is one of the newer types and has penetrated more fields of manufacturing operations in a shorter space of time than any of its predecessors the many catalysts used with epoxies
