the possibility that the continents of the earth have undergone major changes in position during the earth's history has fascinated scholars for at least three hundred years recently evidence from several scientific disciplines has shown that the possibility must be very seriously considered in any study of the surface features of the earth the first part of this volume consists of papers given at a symposium on continental drift held at the annual meeting of the royal society of canada in charlottetown in june 1964 they present the views of three geophysicists a botanist and an astronomer in these papers the present evidence for or against continental drift is reviewed and the authors in most cases draw their own conclusions the reader will find that there is not unanimous agreement in favour of drift nearly all discussions of continental drift stress the possible separation of the americas from europe and africa considerable work has been done on the tracing of structures on each side of the atlantic ocean which might once have been connected geologists and geophysicists working in the arctic or on the eastern seaboard of canada have an important contribution to make to this subject the second part of this volume therefore consists of a group of papers also presented at the charlottetown meeting which throw light on the complicated crustal structure of these regions in any attempt to reconstruct north america as part of europe the features described in these papers will have to be taken into account once again the reader will find differences of opinion on the question of whether the evidence favours a separation of our continent from europe indeed it is because the theory of continental drift is so difficult to confirm without ambiguity by direct observation that it remains controversial but exciting

traces the changing theories about continental drift due to the advances in seismology and experimental studies of the behavior of rocks under high pressure continental stability was the prevailing scientific view until the late 1960s when geologists throughout the world became convinced that crustal plates both continental and oceanic have moved over many degrees of latitude and longitude since the cretaceous period

furnished partisans of continental drift with decisive arguments to take stock of this important question my colleague thellier and i decided in the early summer of 1967 to make it the subject of the annual seminar on earth physics for the school year 1967 68 although research was still developing rapidly the general assembly of the international union of geodesy and geophysics held in switzerland in september particularly some of the meetings in zurich under the auspices of the international committee for the upper mantle appeared to confirm that we had made no important omissions at the conclusion of the seminar where i had been responsible for most of the lectures i resolved to write the present volume for the non specialized scientific reader the project turned out to be a good deal more ambitious than i had thought it is quite an undertaking nowadays to try to survey a rapidly growing subject first of all because of the difficulty of gathering material publication delays are now nearing one year with the result that specialists communicate largely through a selective distribution of reports as well as verbally in frequent colloquia i warmly thank those who helped me in getting unpublished literature especially xavier le pichon even so some essential work came to my knowledge only lately
