the general aim of this book is to provide an elementary exposition of some basic concepts in terms of which both classical and non classical logics may be studied and appraised although quantificational logic is dealt with briefly in the last chapter the discussion is chiefly concerned with propositional calculi still the subject as it stands today cannot be covered in one book of reasonable length rather than to try to include in the volume as much as possible i have put emphasis on some selected topics even these could not be covered completely but for each topic i have attempted to present a detailed and precise exposition of several basic results including some which are non trivial the roots of some of the central ideas in the volume go back to j luka siewicz s seminar on mathematical logic

it is required reading for anyone who wishes to study the subject mathematical reviews the theory of finite simple groups enjoyed a period of spectacular activity in the 1950s and 1960s the first edition of gorenstein s book was published in 1968 at the time of some of the first major classification results the second edition was published in 1980 when it was clear that the classification was understood and the proof was within reach gorenstein s treatment of the subject proved prescient as many of the developments between the two editions could be seen as continuations of the material in the book even now the book remains one of the best sources for an introduction to finite groups and the classification of the simple groups gorenstein s insight provides a guiding light through the many pages that have been dedicated

to the proof

the book will focus on exploiting state of the art research in semantic web and web science the rapidly evolving world wide web has led to revolutionary changes in the whole of society the research and development of the semantic web covers a number of global standards of the web and cutting edge technologies such as linked data social semantic web semantic web search smart data integration semantic web mining and web scale computing these proceedings are from the 6th chinese semantics symposium

this book combines foundational constructions in the theory of motives and results relating motivic cohomology to more explicit constructions prerequisite for understanding the work is a basic background in algebraic geometry the author constructs and describes a triangulated category of mixed motives over an arbitrary base scheme most of the classical constructions of cohomology are described in the motivic setting including chern classes from higher k theory push forward for proper maps riemann roch duality as well as an associated motivic homology borel moore homology and cohomology with compact supports
