agents lipid themselves particularly oxidized ldl protein modification by adp ribose bone marrow study endothelial cell dysfunction angiotensin and the role of infection and inflammation are all discussed in the context of atherosclerotic cardiovascular disease the hypertension section focuses on factors that may be responsible for high blood pressure such as genetic predisposition vascular hyperplasia and remodeling insulin resistance neurological aspects such as hypothalamic peptides also discussed are the possible contributions of the cellular function of the endothelium nutrition kidney dysfunction leptin and the brain novel routes of drug delivery for treatment of hypertension is also a focus as for diabetes the risk factors and mechanisms responsible for diabetic vascular and cardiac dysfunction are discussed lipid profile changes and fibrinolysis in diabetic patients is detailed along with adipogenesis diabetic cardiomyopathy energy metabolism in the diabetic heart vanadate as an alternative to insulin insulin resistance mechanisms and neurotransmitters as targets for the prevention of cardiovascular disease and diabetes these manuscripts were invited from scientists who presented state of the art lectures at the xvii world congress of the international society for heart research held in winnipeg in july 2001

tuberculosis is a disease which once was spoken of in fearful whispers but with improvements in standards of public health and hygiene this dreadful disease seemed largely to have disappeared from the consciousness of the developed world however in 1993 the world health organization declared tuberculosis a global health emergency pointing out that there are now more cases of tuberculosis in the world than at any time in history and that 30 million will die of the disease in the next ten years the resurgence of the disease is by no means confined to the third world with its more problematic public health problems of dense populations in cities and in the refugee camps indeed most of the new cases of tuberculosis are now in the developed countries as described in the overall surveys in this volume the new problems may arise from a variety of modern facts such as the spread of aids poorer social conditions immigration from areas where the disease is already widespread or increased overseas travel in addition there is the prevalence of new forms of resistant mycobacterium tuberculosis this symposium volume presents expert views on these problems and describes the approaches being undertaken by health professionals working with patients as well as the efforts being made in industrial and academic laboratories to develop new understanding of the biological processes and hence new approaches to successful therapy

heart failure has been traditionally explained as a reduction in cardiac pumping capacity caused by problems in the blood till now the therapy prescribed has been symptomatic involving the use of diuretics muscular stimulation and blood vessel relaxants but recent research has focussed on the circumstances leading up to heart failure which includes abnormal hemodynamics atherosclerosis dietary and nutritional anomalies obesity

immunity and other metabolic disorders this book brings together such research in one volume including molecular and cellular aspects of heart failure and its pathophysiology it is a significant contribution to the understanding and prevention of heart failure and will be welcomed by cardiologists pharmacologists biochemists and all those who practice and research the subject the contributors from around the world include australia brazil canada denmark india and usa
