this encyclopaedia of mathematics aims to be a reference work for all parts of mathe

mathematics it is a translation with updates and editorial comments of the soviet mathematical encyclopaedia published by soviet encyclopaedia publishing house in five volumes in 1977 1985 the annotated translation consists of ten volumes including a special index volume there are three kinds of articles in this encyclopaedia first of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used the main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible on the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics these articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question they also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions the second kind of article of medium length contains more detailed concrete problems results and techniques

the presentation of this book is on the comprehensible application of techniques for the approximation of the mathematical problems that are frequently observed in physical sciences engineering technology and mathematical physics the acceptance of the technique for the solution has been justified from mathematical point of view the software required for the approximate solution of the problems applying the appropriate methods numerically developed is the set of programs written in c turbo the text book is primarily intended for advanced undergraduate and the graduate levels in all branches of mathematical sciences and engineering technology a variety of computerised solved problems physical and technical has been discussed in each chapter so that the students can understand the conceptual text easily chapter 7 on differential equations with boundary points is specially focussed because of the fact that a two point second order boundary value problem is occurred very often in the field besides ordinary differential equations of any art have been presented and the results are analysed elaborately some limited examples on partial differential equations have also been treated chapter 9 on laplace transforms should be cordially admitted because an appreciable interest has been developing in recent times in the use of laplace tranforms for solving particular types of differential equations

this book presents mathematical modelling and the integrated process of formulating sets of equations to describe real world problems it describes methods for obtaining solutions of challenging differential equations stemming from problems in areas such as chemical reactions population dynamics mechanical systems and fluid mechanics

chapters 1 to 4 cover essential topics in ordinary differential equations transport equations and the calculus of variations that are important for formulating models chapters 5 to 11 then develop more advanced techniques including similarity solutions matched asymptotic expansions multiple scale analysis long wave models and fast slow dynamical systems methods of mathematical modelling will be useful for advanced undergraduate or beginning graduate students in applied mathematics engineering and other applied sciences
