multidimensional item response theory is the first book to give thorough coverage to this emerging area of psychometrics the book describes the commonly used multidimensional item response theory mirt models and the important methods needed for their practical application these methods include ways to determine the number of dimensions required to adequately model data procedures for estimating model parameters ways to define the space for a mirt model

and procedures for transforming calibrations from different samples to put them in the same space a full chapter is devoted to methods for multidimensional computerized adaptive testing the text is appropriate for an advanced course in psychometric theory or as a reference work for those interested in applying mirt methodology a working knowledge of unidimensional item response theory and matrix algebra is assumed knowledge of factor analysis is also helpful

the eld of sensory science has grown exponentially since the publication of the p vious version of this work fifteen years ago the journal food quality and preference was fairly new now it holds an eminent position as a venue for research on sensory test methods among many other topics hundreds of articles relevant to sensory testing have appeared in that and in other journals such as the journal of sensory studies knowledge of the intricate cellular processes in chemoreception as well as their genetic basis has undergone nothing less than a revolution culminating in the award of the nobel prize to buck and axel in 2004 for their discovery of the olfactory receptor gene super family advances in statistical methodology have accelerated as well sensometrics meetings are now vigorous and well attended annual events ideas like thurstonian modeling were not widely embraced 15 years ago but now seem to be part of the everyday thought process of many sensory scientists and yet some things stay the same sensory testing will always involve human participants humans are tough measuring instruments to work with they come with varying degrees of acumen training experiences differing genetic equipment sensory capabilities and of course different preferences human foibles and their associated error variance will continue to place a limitation on sensory tests and actionable results reducing controlling partitioning and explaining error variance are all at the heart of good test methods and practices
