robots are increasingly being deployed to assist and collaborate with humans in many applications such as medicine navigation and industrial automation to truly collaborate with humans in complex environments robots require advanced cognitive capabilities including the ability to reason with domain specific commonsense knowledge and the noise observations obtained in the presence of partial observability and non deterministic action outcomes research in artificial intelligence ai has resulted in sophisticated symbolic formalisms that use temporal and logic relations to represent commonsense domain knowledge as well as probabilistic data driven frameworks that quantitatively represent uncertainty in the decision making process of robot systems stand alone symbolic or stochastic ai methods have limitations when applied to robots in complex scenarios symbolic ai methods reason with relational descriptions of the attributes of the domain and the robot to guide the robot s behavior it is however often computationally intractable to use these methods to reason about uncertainty quantitatively or to operate at the level of granularity required for precise interaction with objects in complex domains probabilistic and data driven ai methods on the other hand elegantly represent uncertainty quantitatively and provide mechanisms for reasoning and acting at the level of granularity required for interaction with the physical worlds these methods however offer limited expressiveness for complex cognitive concepts
