contemporary social science in general and economics in particular are dominated by the method of logical positivism in the british tradition in contrast to the british philosophy subjectivism and interpretative methodology in theory and practice adopts subjectivism and interpretation methodology to understand human behavior and social action unlike positivism this subjectivist approach with its root in german idealism takes human experience as the sole foundation of factual knowledge all objective facts have to be interpreted and evaluated by

human minds in this approach experience knowledge expectation plans errors and revision of plans are key elements specifically this volume uses the subjectivist approach originated in max weber's interpretation method alfred schutz's phenomenology and peter berger and thomas luckmann's sociology of knowledge to understand economic and social phenomena the method brings human agency back into the forefront of analysis adding new insights not only in economics and management but also in sociology politics psychology and organizational behavior

this volume of theory and method in higher education research contains contemporary contributions to international debates regarding the application and development of theory and methodology in researching higher education

the introduction of permutation tests by r a fisher relaxed the parametric structure requirement of a test statistic for example the structure of the test statistic is no longer required if the assumption of normality is removed the between object distance function of classical test statistics based on the assumption of normality is squared euclidean distance because squared euclidean distance is not a metric i.e. the triangle inequality is not satisfied it is not at all surprising that classical tests are severely affected by an extreme measurement of a single object a major purpose of this book is to take advantage of the relaxation of the structure of a statistic allowed by permutation tests while a variety of distance functions are valid for permutation tests a natural choice possessing many desirable properties is ordinary i.e. non squared euclidean distance simulation studies show that permutation tests based on ordinary euclidean distance are exceedingly robust in detecting location shifts of heavy tailed distributions these tests depend on a metric distance function and are reasonably powerful for a broad spectrum of univariate and multivariate distributions least sum of absolute deviations l1ad regression linked with a permutation test based on ordinary euclidean distance yields a linear model analysis which controls for type i error

domain decomposition is an active interdisciplinary research area that is devoted to the development analysis and implementation of coupling and decoupling strategies in mathematics computational science engineering and industry a series of international conferences starting in 1987 set the stage for the presentation of many meanwhile classical results on substructuring block iterative methods parallel and distributed high performance computing etc this volume contains a selection from the papers presented at the 15th international domain decomposition conference held in berlin germany july 17-25 2003 by the world's leading experts in the field its special focus has been on numerical analysis computational issues complex heterogeneous problems industrial problems and software development

this book brings to life best practices of human simulation maximizing the standardized patient simulation methodology that has played a major role in health professions learning and assessment since the 1960s each chapter reflects the association of simulation educators standards of best practices sobps and provides guidance for implementation multiple insights are offered through embedded interviews with international experts to provide examples illustrating successful

strategies the human simulation continuum model a practical and theoretical framework is introduced to guide educators in decision making processes associated with the full range of human simulation the continuum model spans improvisations structured role play embedded participants and simulated standardized patients this book also provides the full how to for sp methodology covering topics including case scenario development creating training material training techniques for case portrayal training communication and feedback skills gta muta pta training sp program administration and professional development for sp educators a pragmatic user friendly addition to the comprehensive healthcare simulation series implementing best practices in standardized patient methodology is the first book framed by the aspe sobps embracing best practices in human simulation and marshaling the vast expertise of a myriad of sp educators

this book is suitable as a textbook for a first course on dynamic relaxation technique in civil and mechanical engineering curricula it can be used as a reference by engineers and scientists working in the industrial sector and in academic institutions the first chapter includes an introduction to the dynamic relaxation method dr which is combined with the finite differences method fd for the sake of solving ordinary and partial differential equations as a single equation or as a group of differential equations in this chapter the dynamic relaxation equations are transformed to artificial dynamic space by adding damping and inertia effects these are then expressed in finite difference form and the solution is obtained through iterations in the second chapter the procedural steps in solving differential equations using the dr method were applied to the system of differential equations i e ordinary and or partial differential equations the dr program performs the following operations reads data file computes fictitious densities computes velocities and displacements checks stability of numerical computations checks convergence of solution and checks wrong convergence at the end of this chapter the dynamic relaxation numerical method coupled with the finite differences discretization technique is used to solve nonlinear ordinary and partial differential equations subsequently a fortran program is developed to generate the numerical results as analytical and or exact solutions
