this monograph provides some useful tools for performing global geometric analysis on real analytic manifolds at the core of the methodology of the book is a variety of descriptions for the topologies for the space of real analytic sections of a real analytic vector bundle and for the space of real analytic mappings between real analytic manifolds among the various descriptions for

these topologies is a development of geometric seminorms for the space of real analytic sections to illustrate the techniques in the book a number of fundamental constructions in differential geometry are shown to induce continuous mappings on spaces of real analytic sections and mappings aimed at researchers at the level of doctoral students and above the book introduces the reader to the challenges and opportunities of real analytic analysis and geometry

the ninth in the series of ima conferences on cryptography and coding was held as ever at the royal agricultural college Cirencester from 16-18 Dec 2003 the conference's varied programme of 4 invited and 25 contributed papers is represented in this volume the contributed papers were selected from the 49 submissions using a referee process the contributed and invited papers are grouped into 5 topics coding and applications applications of coding in cryptography cryptography cryptanalysis and network security and protocols these topic headings represent the breadth of activity in the areas of coding cryptography and communications and the rich interplay between these areas assembling the conference programme and this proceedings required the help of many individuals I would like to record my appreciation of them here firstly I would like to thank the programme committee who aided me immensely by evaluating the submissions providing detailed written feedback for the authors of many of the papers and advising me at many critical points during the process their help and cooperation was essential especially in view of the short amount of time available to conduct the reviewing task the committee this year consisted of Mike Darnell Mick Ganley Bahram Honary Chris Mitchell Matthew Parker Nigel Smart and Mike Walker

circulation of blood is vital for the survival of vertebrates including man mainly it plays an important role in carrying food nutrients and oxygen to every tissue and organ and in removing all waste products and carbon dioxide any imbalance in the hemostatic and cardiovascular systems can lead to death and severe debility a number of animals have developed mechanisms to target these systems and exploit the vulnerability in some species for example snakes such mechanisms are used to immobilize and kill the victim prey whereas in others for example insects such as leeches mosquitoes and ticks they are used to provide a continuous supply of blood these mechanisms include but are not limited to procoagulant and anticoagulant actions that affect the coagulation cascade and platelet aggregation as well as altering vasodilatory responses in all these various animals these mechanisms have evolved to perfection over millions of years to support their survival in last 3-4 decades due to the efforts of scientists from various backgrounds including biology protein chemistry molecular biology pharmacology hematology and structural biology significant progress in understanding the structure-function relationships as well as the mechanism of action have been made in a number of exogenous factors that affect blood coagulation platelet aggregation and vasodilation from various animals these exogenous factors have contributed significantly to the development of research tools as well as providing

new therapeutic agents with the increase average age of the population coupled with changes in life style in recent years there has been a significant increase in cardiovascular and hematological disorders thus scientists in both academic institutions as well as the pharmaceutical industry are developing better therapeutic agents to improve the quality of life this impetus has lead to the search for novel agents from various sources that interfere with cardiovascular and hematalogical processes although at first glance exogenous factors appear to function as villains several life saving drugs have been developed based upon these factors such drugs or drug leads include those that inhibit the angiotensin converting enzymes captopril and enalapril that block platelet receptors eptifibatide and tirofiban or that digest thrombotic plugs alfineprase and bat plasminogen activator to name a few several new and exciting success stories are currently unfolding in this book recent studies on some of the exogenous factors that play crucial roles in cardiovascular and hematological disorders are reviewed in order to consolidate the efforts in this area of research and to recruit new talented researchers the 25 30 review chapters each written by experts in their field compiled herein are devoted to exogenous factors affecting platelet aggregation anticoagulant and procoagulant proteins fibrinolytic proteins and hypotensive agents for details see contents of the book this book is intended to help to create elevated awareness and enthusiasm in the field of exogenous factors i believe that this book will provide greater impetus to the search for novel proteins based on naturally occurring exogenous factors this will be the first book dealing extensively with exogenous factors in the last 25 years the book will provide a ready reference to the different approaches used to solve complex problems in protein chemistry and pharmacology of exogenous factors the book will update our understanding of the structure function relationships and mechanisms of action of exogenous factors and provide great insights into future directions for solving the remaining challenges

a polynomial identity for an algebra or a ring a π is a polynomial in noncommutative variables that vanishes under any evaluation in a π algebra satisfying a nontrivial polynomial identity is called a π algebra and this is the main object of study in this book which can be used by graduate students and researchers alike the book is divided into four parts part 1 contains foundational material on representation theory and noncommutative algebra in addition to setting the stage for the rest of the book this part can be used for an introductory course in noncommutative algebra an expert reader may use part 1 as reference and start with the main topics in the remaining parts part 2 discusses the combinatorial aspects of the theory the growth theorem and shirshov's bases here methods of representation theory of the symmetric group play a major role part 3 contains the main body of structure theorems for π algebras theorems of kaplansky and posner the theory of central polynomials martin's theorem on azumaya algebras and the geometric part on the variety of semisimple representations including the foundations of the theory of cayley hamilton algebras part 4 is devoted first to the proof of the theorem of razmyslov kemer and braun on the nilpotency of the nil radical for finitely generated π algebras over noetherian rings then to the theory of kemer and the specht problem finally

the authors discuss pi exponent and codimension growth this part uses some nontrivial analytic tools coming from probability theory the appendix presents the counterexamples of golod and shafarevich to the burnside problem
