after the discovery of the tobacco mosaic virus by d i Ivanovskii in 1892 the new science of virology was born and began to develop rapidly the number of viruses now known is enormous and they can infect nearly all animal and plant organisms microorganisms themselves are no exception to this rule despite intensive study of viruses their origin and nature are still a subject for speculation and hypothesis the general concept of viruses embraces a wide group of biologically active structures occupying an intermediate position between living and nonliving matter the dual character of viruses is determined by the fact that while they do not possess an independent system of metabolism which is a characteristic feature of every living being they nevertheless carry

within themselves all the necessary information for autoreproduction a striking feature of the virus is that it consists essentially of two components a protein envelope and the nucleic acid contained within it in contrast to the elementary structural unit of the living organism the cell which contains two types of nucleic acid dna and rna the virus particle contains only one type of nucleic acid either dna or rna it is perhaps this which is responsible for the imperfection of the virus as a living organism

this book advocates a more thoughtful approach to urban water management the approach involves reducing water consumption harvesting rainwater recycling rainwater and adopting sustainable drainage systems suds where surface water is not sent straight to drains but is intercepted by features like green roofs rain gardens swales and ponds cities in particular need to change the existing linear model of water consumption and use to a more circular one in order to survive the water sensitive city brings together the various specialised technical discussions that have been continuing for some time into a volume that is more accessible to designers engineers and architects urban planners and managers and policymakers
