the metabolism of sulfur especially by sulfurtransferases had been intensively studied in mid 1900 s three enzymes cystathionine β synthase cbs cystathionine γ lyase cse and 3 mercaptopyruvate sulfurtransferase 3mst were found to have the capacity to produce h2s in vitro however h2s was recognized simply as a by product of the metabolic pathways or as a marker for evaluating the activity of enzymes rather than as a physiological active molecule in the late 1980 s relatively high concentrations of sulfide were measured in the brain that led to the successive studies of identifying the physiological functions of h2s recently the steady state concentrations of h2s have been re evaluated and found to be much less than that initially measured however despite these differences such re

evaluations served to further confirm the existence of h2s in mammalian tissues h2s is produced in almost every organ and plays various roles such as neuromodulation vasodilation insulin release inflammation angiogenesis and cytoprotection the unregulated production of h2s and improper responses of target molecules are involved in the pathogenesis of various diseases this book focuses on these topics as well as on the recent progress in the biology and the therapeutic development of this molecule
