nonlinear functional analysis is a central subject of mathematics with applications in many areas of geometry analysis fluid and elastic mechanics physics chemistry biology control theory optimization game theory economics etc this work is devoted in a self contained way to several subjects of this topic such as theory of accretive operators in banach spaces theory of abstract cauchy problem metric and topological fixed point theory special emphasis is given to the study how these theories can be used to obtain existence and uniqueness of solutions for several types of evolution and stationary

equations in particular equations arising in dynamical population and neutron transport equations are discussed

this book investigates how domain dependent quantities from geometry and physics behave when the domain is perturbed of particular interest are volume and perimeter preserving perturbations the first and second derivatives with respect to the perturbation are exploited for domain functionals like eigenvalues energies and geometrical quantities they provide necessary conditions for optimal domains and are useful when global approaches like symmetrizations fail the book is example driven and illustrates the usefulness of domain variations in various applications

this book derives new Hardy inequalities with double singular weights at an interior point and on the boundary of the domain we focus on the optimality of Hardy constant and on its attainability applications include results about existence nonexistence and controllability for parabolic equations with double singular potentials estimates from below of the first eigenvalue of p -Laplacian with Dirichlet boundary conditions

the book is focused on physical interpretation and visualization of the obtained invariant solutions for nonlinear mathematical modeling of atmospheric and ocean waves this volume represents a unique blend of analytical and numerical methods complemented by the author's developments in ocean and atmospheric sciences and it is meant for researchers and graduate students interested in applied mathematics and mathematical modeling

fractional evolution equations describe various complex and nonlocal systems with memory this volume investigates fractional evolution equations in infinite intervals the book covers a range of topics including the existence uniqueness attractivity and applications to fractional diffusion equations and fractional Schrödinger equations researchers and graduate students in pure and applied mathematics will find this a useful reference

the behavior of materials at the nanoscale is a key aspect of modern nanoscience and nanotechnology this book presents

rigorous mathematical techniques showing that some very useful phenomenological properties which can be observed at the nanoscale in many nonlinear reaction diffusion processes can be simulated and justified mathematically by means of homogenization processes when a certain critical scale is used in the corresponding framework
